

POGO IV

Quad

Pneumatically Operated Gate Opener

The *Quad* was specifically designed to operate safely in a space as narrow as 40". The steering control arm allows the operator to easily position the POGO IV. Once in place the pneumatic controls raise and lower the power unit, advance and retract the power unit, and change the rotation direction of the drive bit.

The POGO IV adjusts to varying capstan heights, making this model ideal for all slide gate applications.
